

Exoplanet population properties from the radial-velocity and transit surveys

Stéphane Udry
Geneva University/Geneva Observatory
Switzerland

In 1995, a breakthrough: the first planet around another Sun

A Swiss team from the Geneva University discovers a planet -
51 Pegasi b - 48 light years from Earth.

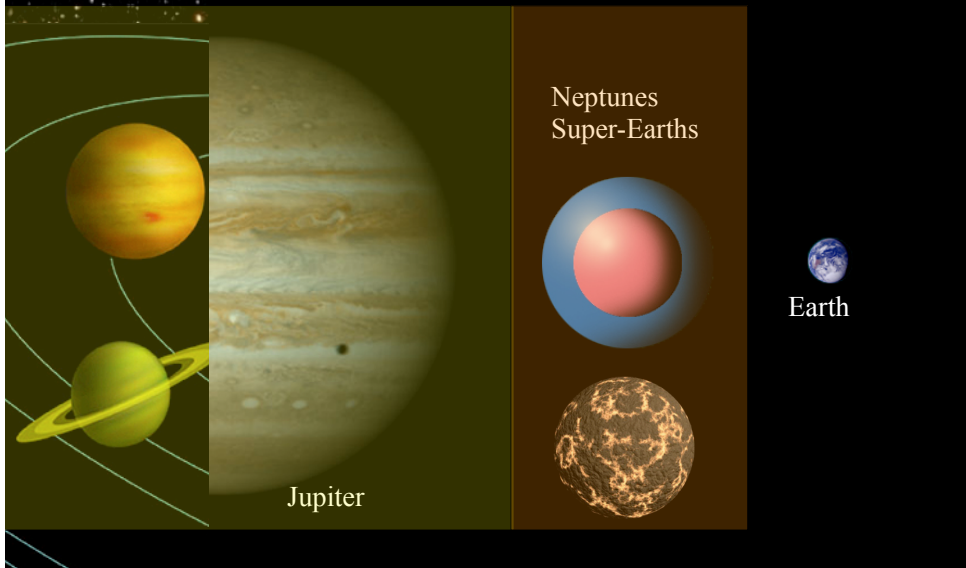

Temporal evolution of the discoveries

Towards lower masses

First 10 years

Now

Future

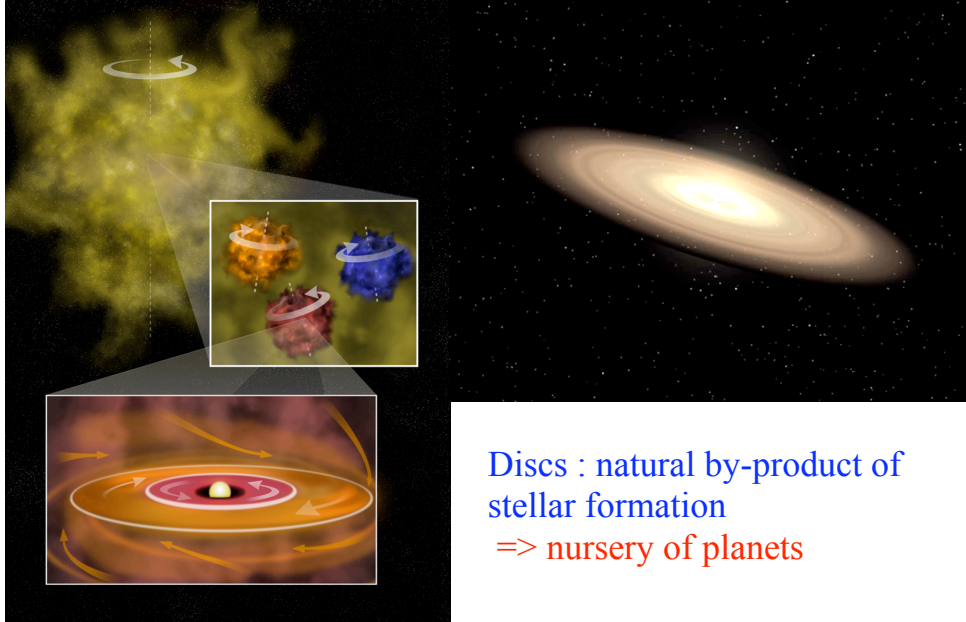

outline

- **General context**
- **RV's: Statistical properties from super-Earths to giant planets.**
 - Geneva: the Coralie and HARPS surveys
 - planetary orbital parameters (gaseous giants vs low-mass planets)
 - multi-planet systems
 - properties of parent stars (metallicity, M-dwarf survey)
- **Insights from transits (ground-based, CoRoT, Kepler)**
 - physical planet properties
 - system geometries
 - summary of important Kepler findings
- **The detection of Earth-type planets in the HZ of stars**
 - Status: M-dwarfs, solar-type stars
 - instrumental progress for RV's and limitations
 - other techniques (space)

Stellar and planetary formation

Collapse of a gas cloud

Discs : natural by-product of stellar formation
=> nursery of planets

Planets build up from the gas and dust particles in the protoplanetary discs

Gravitational instability

L. Mayer

Core accretion

Safronov 69'
Pollack et al. 96'

How do planets form?

Comparison observations-models:
constraints for models of planet formation

Initial conditions
discs, zones of stellar formation

Observed distribution of end products
statistical distributions: orbital elements, stellar host properties

Available exoplanet sample

All Catalogs
update : 05 June 2012

The extra-solar planet encyclopedia (Jean Schneider, Paris)

All Candidates detected

775 planets

<ul style="list-style-type: none"> ▶ Candidates detected by radial velocity or astrometry update : 05 June 2012 ▶ Transiting planets update : 05 June 2012 	<ul style="list-style-type: none"> 567 planetary systems 712 planets 96 multiple planet systems

Detection methods: 2 body motion property

RV technique

Astrometry

Transit

+ Photometric variation: phase function

Planet detectability with radial velocities

$$k_1 = \frac{28.4 \text{ m s}^{-1}}{\sqrt{1-e^2}} \frac{m_2 \sin i}{M_{\text{Jup}}} \left(\frac{m_1 + m_2}{M_{\text{Sun}}} \right)^{-2/3} \left(\frac{P}{1 \text{ yr}} \right)^{-1/3}$$

Jupiter	@ 1 AU	: 28.4 m s ⁻¹
Jupiter	@ 5 AU	: 12.7 m s ⁻¹
Neptune	@ 0.1 AU	: 4.8 m s ⁻¹
Neptune	@ 1 AU	: 1.5 m s ⁻¹
Super-Earth (5 M _⊕)	@ 0.1 AU	: 1.4 m s ⁻¹
Super-Earth (5 M _⊕)	@ 1 AU	: 0.45 m s ⁻¹
Earth	@ 1 AU	: 0.09 m s ⁻¹

Extra-solar planets: radial-velocity detections

1995-2012: >700 RV planets (+ transit candidates)

Statistical properties

- Percentage
 - ~10% of observed stars host giants
 - ~0.5-1% of Hot Jupiters
- Mass distribution
 - $1.5 M_{\text{Earth}} < M_{\text{pl}} < 20 M_{\text{Jup}}$
- Period
 - $0.74 \text{ d} < P < \dots$
- Eccentricity-period distribution
 - $0 < e < 0.93$
- Multi-planet systems
- Properties of host stars
 - metallicity, mass, binaries

WARNINGS

- 1) There are biases !!!!
 - Generally avoid "unsuitable" stars for RV searches (activity, rotation, age, ...)
 - Magnitude-limited samples, Metallicity-biased samples
- 2) Uniformity of precision and coverage?
- 3) Heterogeneity of targets (dwarfs, giants, binaries, etc.)

BUT

- 1) Surveys with "non solar" targets are progressing
- 2) There are large good samples
 - LicK+Keck+AAT 1330 FGKM stars
 - CORALIE volume-limited sample: 1650 F-K dwarfs

The Geneva 1.2-m Euler telescope + CORALIE spectrograph at La Silla Observatory (ESO/Chile)

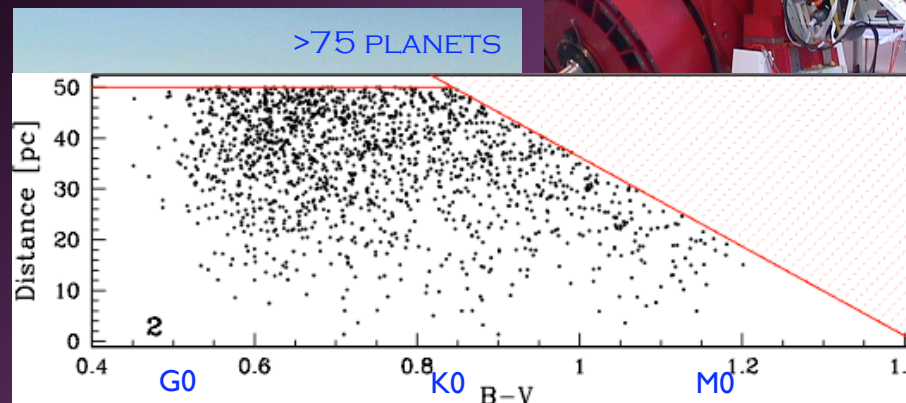

Euler+Coralie – La Silla (1998-...)

1.2-m Euler Swiss telescope
Simultaneous thorium technique

Precision: ~5 m/s
-> Photon-noise limited (-> 5-10 m/s)

Volume-limited sample: 1650 F8-M0 dwarfs
(Queloz et al. 2000, Udry et al. 2000)

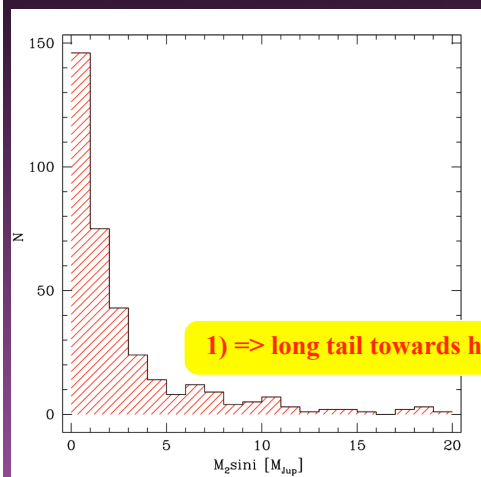

M. Mayor, S. Udry, D. Queloz, F. Pepe, D. Ségransan, C. Lovis, D. Naef, N.C. Santos, M. Gillon, P. Figuera, M. Marmier, A. Triaud, J. Hagelberg, X. Dumusque, M. Lendl, J. Sahlmann, +...

Planetary mass distribution

End of 2011: > 700 planets

Linear scale

1) => long tail towards high masses!

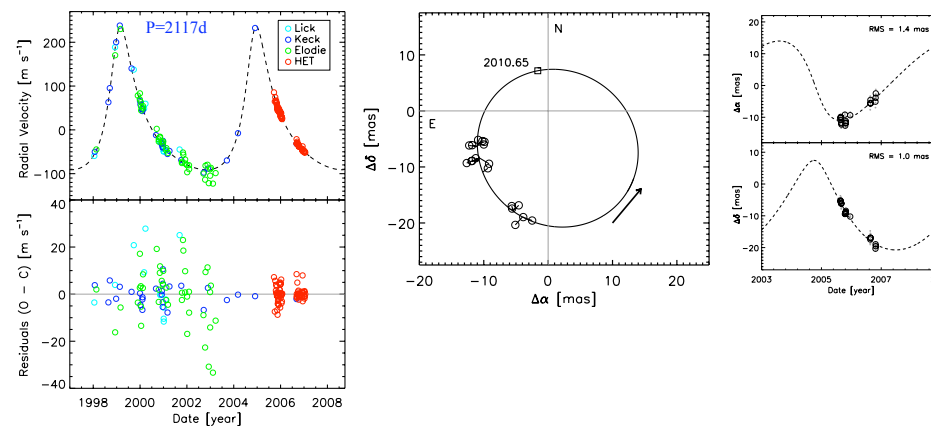

Massive planets: true mass from astrometry

HD 33636 b (Bean et al. 2007)

Radial velocities
 $m_2 \sin i = 9.3 M_{Jup}$

HST Fine Guidance Sensor
 $m_2 = 142 \pm 11 M_{Jup}$

→ late M star companion

Massive planets: "true" mass from astrometry

Ups And (McArthur et al. 2010)
HST Fine Guidance Sensor

$P_b = 4.6$ d
 $P_c = 240$ d
 $P_d = 1281$ d

$m_b \sin i = 0.7 M_{Jup}$
 $i_c = 8^\circ$ $m_c = 12 M_{Jup}$
 $i_d = 24^\circ$ $m_d = 10 M_{Jup}$

HR8799 b, c, d : 7, 10 & 10 M_{Jup}
(Marois et al. 2009)

Beta Pic b : 8 M_{Jup}
(Lagrange et al. 2009, 2010)

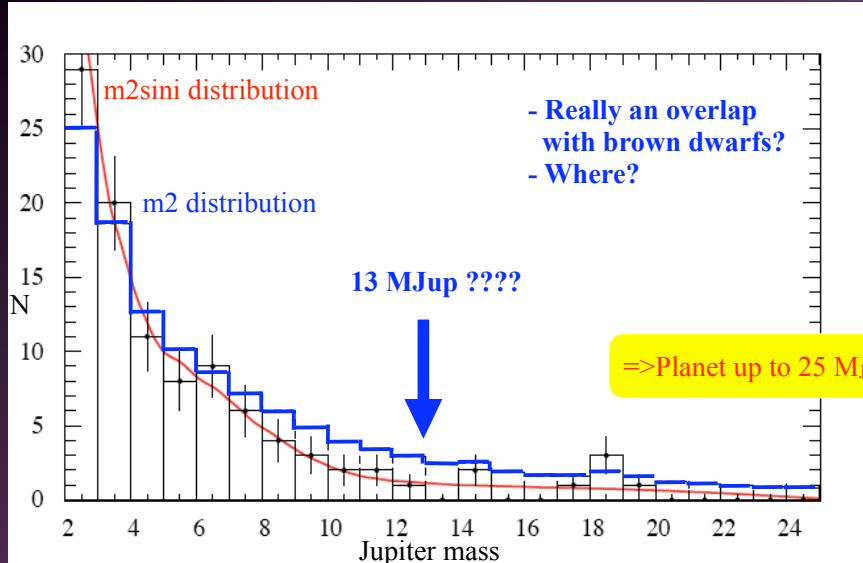

Formalhaut b : 3 M_{Jup}
HST
(Kalas et al. 2009)

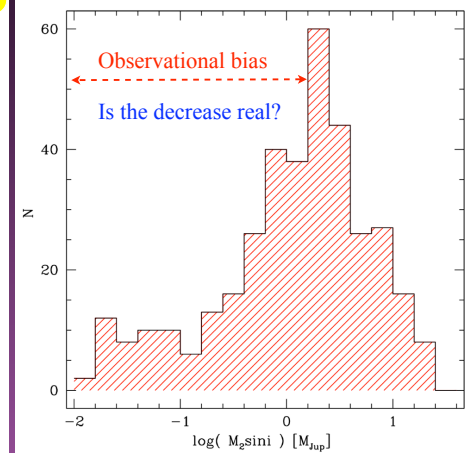

Planetary mass distribution

Segransan et al. 2009

Planetary mass distribution

2) => rising towards lower masses!

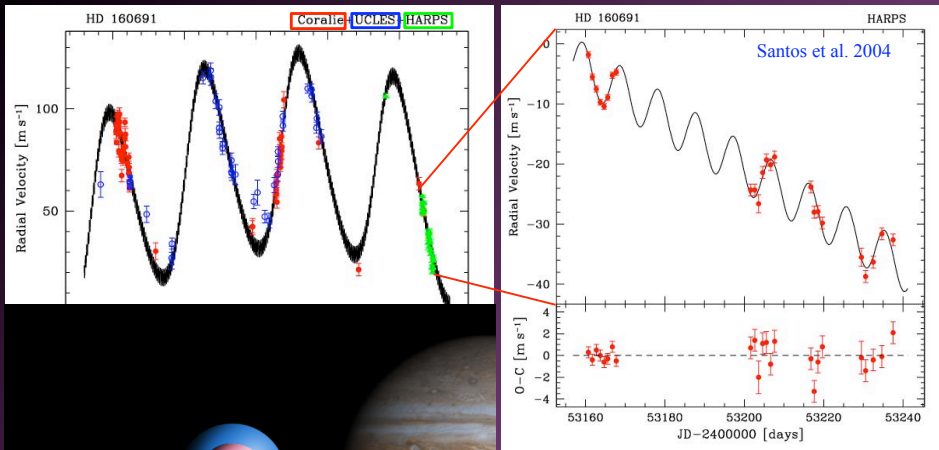

Planet detectability with radial velocities

$$k_1 = \frac{28.4 \text{ m s}^{-1}}{\sqrt{1 - e^2}} \frac{m_2 \sin i}{M_{\text{Jup}}} \left(\frac{m_1 + m_2}{M_{\text{Sun}}} \right)^{-2/3} \left(\frac{P}{1 \text{ yr}} \right)^{-1/3}$$

Jupiter	@ 1 AU	: 28.4 m s ⁻¹
Jupiter	@ 5 AU	: 12.7 m s ⁻¹
Neptune	@ 0.1 AU	: 4.8 m s ⁻¹
Neptune	@ 1 AU	: 1.5 m s ⁻¹
Super-Earth (5 M _⊕)	@ 0.1 AU	: 1.4 m s ⁻¹
Super-Earth (5 M _⊕)	@ 1 AU	: 0.45 m s ⁻¹
Earth	@ 1 AU	: 0.09 m s ⁻¹

Precision at work -> zoom toward smaller-mass planets

$p = 9.5 \text{ d}$
 $m_p = 10.5 M_{\text{Earth}}$

HARPS: stability < 1 m/s

- Observatoire de Genève
- Physikalisches Institut, Bern
- Observatoire Haute-Provence
- Service d'Aéronomie, Paris
- ESO

The HARPS search for low-mass planets

- Sample of ~400 slowly-rotating, nearby FGK dwarfs from the CORALIE planet-search survey + known planets
- HARPS $\log(R'_{\text{HK}}) < -4.8 \Rightarrow \sim 376$ good targets
Non evolved (Sousa et al. 2009)
- Observations ongoing since 2004
- Focus on low-amplitude RV variations
 \Rightarrow about 50% of HARPS GTC time (250 nights)
 \Rightarrow continuing with 280 nights over 4 years ($\rightarrow 2013$)

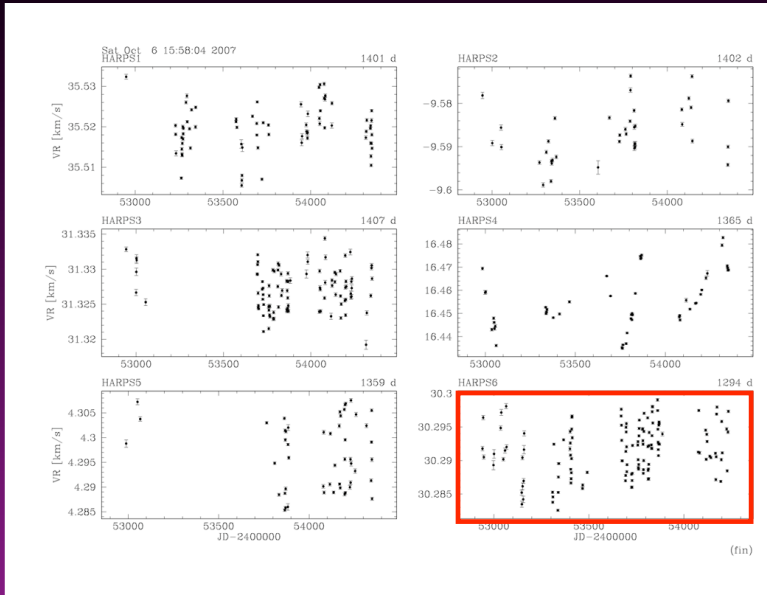

HARPS

ESO-3.6m @ La Silla

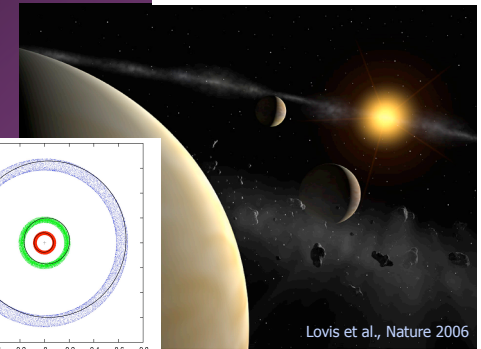

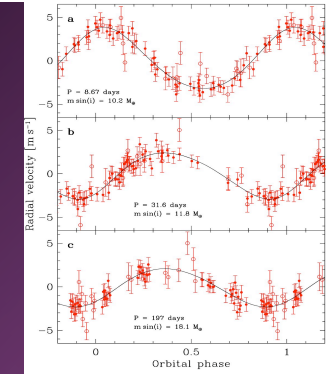

HARPS: a blossom of candidates (1)

HD 69830: A trio of Neptunes

$P_1 = 8.67$ days $a = 0.078$ AU $M \sin i = 10.2 M_{\text{Earth}}$
 $P_2 = 31.6$ days $a = 0.186$ AU $M \sin i = 11.8 M_{\text{Earth}}$
 $P_3 = 197$ days $a = 0.63$ AU $M \sin i = 18.1 M_{\text{Earth}}$

HARPS@3.6-m telescope, ESO La Silla

Lovis et al., Nature 2006

An emerging population of Hot Neptunes and Super-Earths

Mayor et al. A&A 2009

$e_3 = 0.16$	$e_6 = 0.0$	
$m_3 \text{ sini} = 11.8 M_{\oplus}$	$m_6 \text{ sini} = 22 M_{\oplus}$	

Lovis, Segransan, Udry, Mayor et al. 2010

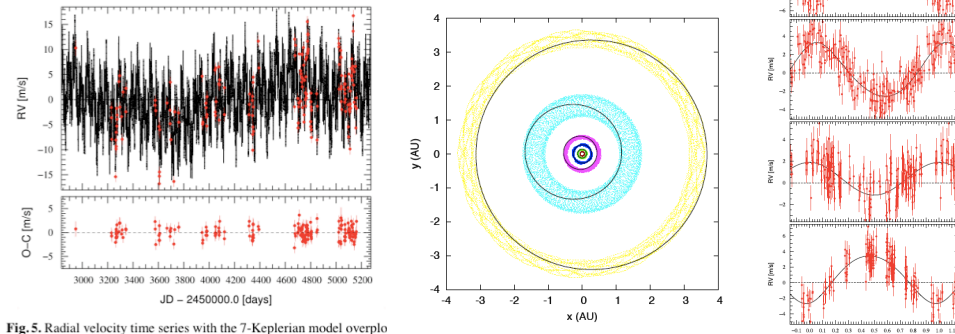

Fig. 5. Radial velocity time series with the 7-Keplerian model overlaid

HARPS planets

Combined Coralie+HARPS stellar sample

CORALIE volume-limited sample:

- distance < 50 pc
- $\log R'_{HK} < -4.75$ (F,G); -4.70 (K)
- no binaries
- measurement precision ~ 5 - 10 m/s (depending on star magnitude)

822 FGK stars (1998 to present)

Focus on gaseous giant planets, long periods

HARPS subsample:

- measurement precision ~ 0.5 m/s (photon noise + instrument)

376 FGK stars (2003 to present)

Focus on super-Earths and Neptune-mass planets

The Msini - log P plane

155 planets in 102 planetary systems

Occurrence frequency estimate

1) Detection limits for each star

Occurrence frequency estimate

2) Detection probability of the survey

HARPS + Coralie

HARPS only

3) Occurrence rate

$$f = N_{pl} / N'_{star}$$

N'_{star} = # of star for which the planet is detectable

Mass distribution

Predominant occurrence of planets with $m2sin i < 30$ Earth-masses ...and for $P < 100$ days

Detections in the global sample

Mass distribution

with incompleteness correction

corrected observed

Formation tracks

$M_{\text{star}} = 1 M_{\odot}$
Nominal model

Type I migration
(Analytical rate reduced by f_i)

Type II migration
(Disk dominated: $M_p < M_{\text{disk,loc}}$)

Type II migration
(Planet dominated: $M_p > M_{\text{disk,loc}}$ & disk limited gas accretion)

Also
Ida & Lin (2004-2010) models

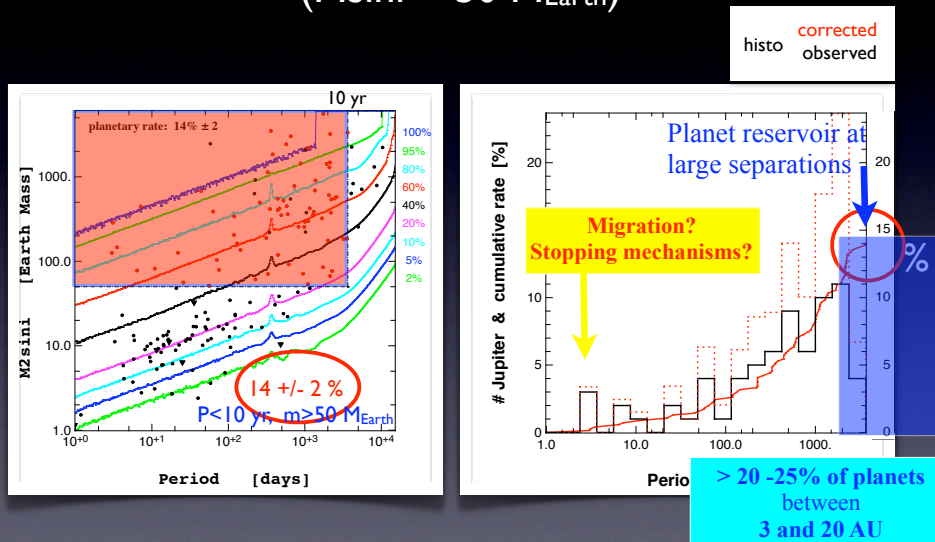

Mass distribution with incompleteness correction

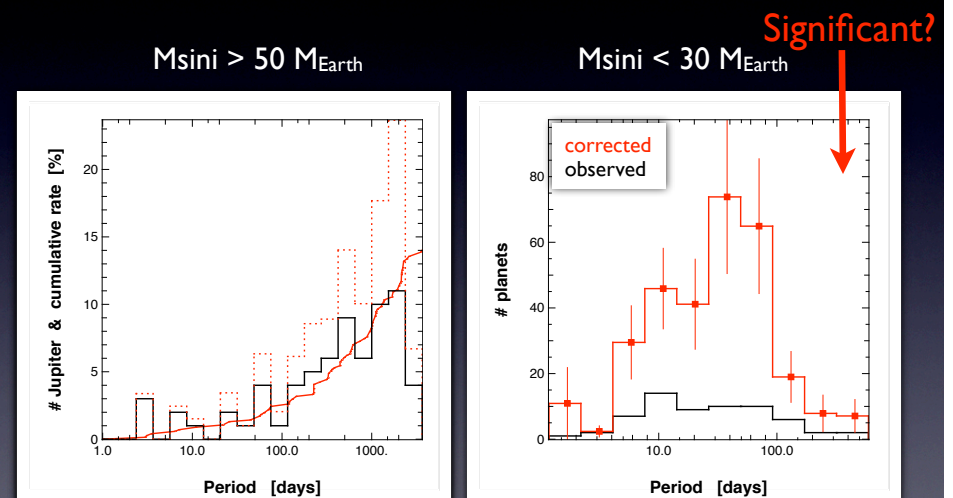

corrected
observed

Gaseous giant planets ($M_{\text{sini}} > 50 M_{\text{Earth}}$)

Period distribution for $M_{\text{sini}} < 30 \text{ Earth-masses}$

Exoplanet eccentricities

- High observed eccentricities
 - $\langle e \rangle = 0.28$ any planet of the SS

**Origin?
Formation - evolution?**

- Possible explanations
 - Planet-planet interactions
 - Planet-planetesimal interaction
 - Influence of stellar or planet companion (Kozai effect)
 - Planet-disk interaction ($M_{pl} > 10 M_{Jup}$)
 - Dynamical interactions in a cluster
 - Multi-planet migration
 - Others

Radial-velocity Systems with n>2 planets

multi-planet systems: many are almost optimally "packed"

Also a constraint for planet formation models!

Lovis et al. 2010

Eccentricities as a function of Msini

Lack of eccentric low-mass planets

**Formation?
Stability?**

Especially taking into account that
1. "e" is often overestimated
2. small-mass planets in systems

Multi-planetary systems (RV surveys)

- Present statistics
- RV: 145 planets in multi-planet systems: ~ 20-25 % of known exoplanets (+ transit candidates)**
- Most of them with 2 planets
- HD10180: 7 planets
- 55 Cnc : 5 planets
- Mu Ara, Gl876 : 4 planets
- Ups And, HD69830, HD40307: 3 planets

Structure helps us to understand/ constrain planet-formation scenarios

=> Importance of dynamics (stability, Inner structure,...)

Need for good modeling of evolution processes!

- longest-running programmes --> largest fraction of multi-planet systems
- Planets mainly form in multi-planet systems**

Need for multi-planet formation models!

Multiplicity

> 70 % of planetary systems with $m_{2\text{sin}i} < 30 M_{\text{Earth}}$ include more than one planet

Host star metallicities

Blue : Entire sample
 Black : $M_{\text{sin}i} > 100 M_{\text{Earth}}$
 Red : $M_{\text{sin}i} < 30 M_{\text{Earth}}$

Small-mass planets: **no clear dependency with metallicity**
 => anticorrelation of planet occurrence probability (TBC)

Properties of planet-host stars: i) metallicity

Giant gaseous planets Stars with planets are more metal rich?

(Gonzalez 1997, 1998, 1999)

Udry & Santos, ARA&A 2007

Santos et al. 2001-2006
 Fischer & Valenti 2002-2005

- Well-defined samples with and without planets
- Uniform analyses
- Large number of stars

Average: **2 regimes**
 flat + power law

Constant probability at low metallicities ?

Properties of planet-host stars: ii) primary mass

Equal bin in $\log(M_{\text{star}})$

- M dwarfs
- solar stars
- higher masses ([sub]giants)

Planetary system mass
 planet masses/star number

=> mass of planetary material scales with M_{star}

RV bias
 underestimate the last bin

Constraints from transit detections

2000-2010: ~100 transiting planets

Short periods:
high probabilities
of transit

The power of shadows: photometric transit method

- **Periods**
 $P = 3 - 7$ days
- **Probability**
 $p_t = R_{\text{star}} / a = 0.1$
- **Depth**
 $\delta I / I = (R_{\text{pl}} / R_{\text{star}})^2 = 0.01$

$R_{\text{pl}}, M_{\text{pl}} (VR), Q$
Constraints for models of
planetary inner structure

Photometric surveys :V= 8-14 mag

SWASP

TrES, HAT, SWASP, XO

wide-angle surveys with small
commercial cameras

Mass-radius-density relation for planets

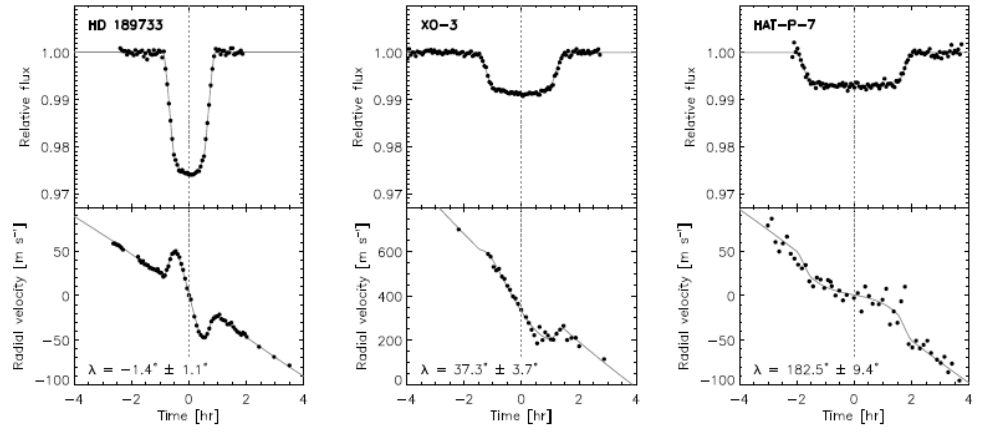

Gaseous planets

Rossiter-McLaughlin effect

Known since the early 20th century for eclipsing binaries, we can **observe a transit spectroscopically**. As the planet moves across the stellar disc, it covers part of it that move at different relative velocities to us showing an anomaly in the radial velocity curve.

Formation-evolution mechanisms?
Alternative models:
- migration by 3-body dynamics (Kozai?)
- evolution of 3 interacting planets?

Retrograde candidates (Triaud et al. 2010)

Atmospheres characterization of extrasolar planets

...Hot Jupiters are the best targets

Transiting planets

Opaque atmosphere
↓
Planet is "larger"
↓
Transit is deeper

Primary eclipse: transmission in visible range

Transmission spectroscopy

Identification of atoms and molecules

HST detects additional sodium absorption due to light passing through planetary atmosphere as planet transits across star

(Charbonneau et al. 2002)

Solar composition + $T > 1000K$

-> H_2, H_2O

(Grillmaire et al. 2008, Swain et al. 2008, 2009)

Also

- Na (Charbonneau et al. 2002)
- CO, CO₂ (Swain et al. 2009a,b, Madhusudhan & Seager 2009)
- CH₄ (Swain et al. 2008)

Rem: mainly for the 2 brightest stars with transit, HD209458 and HD189733

Atmospheres characterization of extrasolar planets

Transiting planets

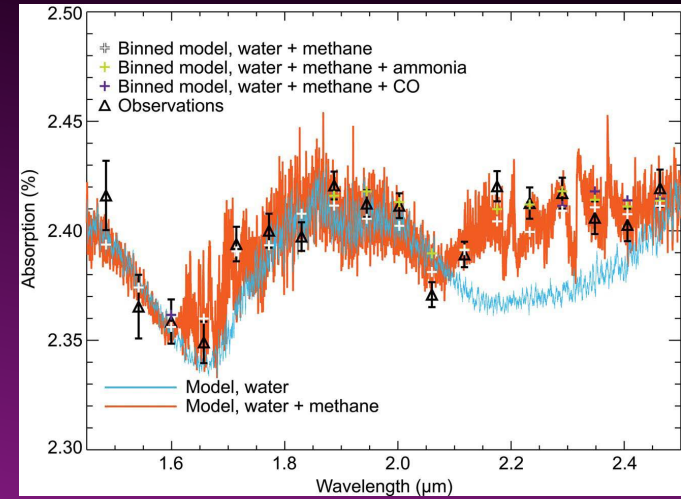

Secondary eclipse: IR emission

Primary eclipse: transmission in visible range

Transmission Spectra of Planet

HST Nicmos finds H_2O and CH_4 in HD189733b (Swain et al. 2008)

Detection of secondary eclipses HD189733

Transits of terrestrial planets

- Giant planets: 0.01 mag
- Terrestrial planets: 0.0001 mag

1235 Feb 2011 → Kepler candidates (1781, Sept 2011) → 2326 Feb 2012

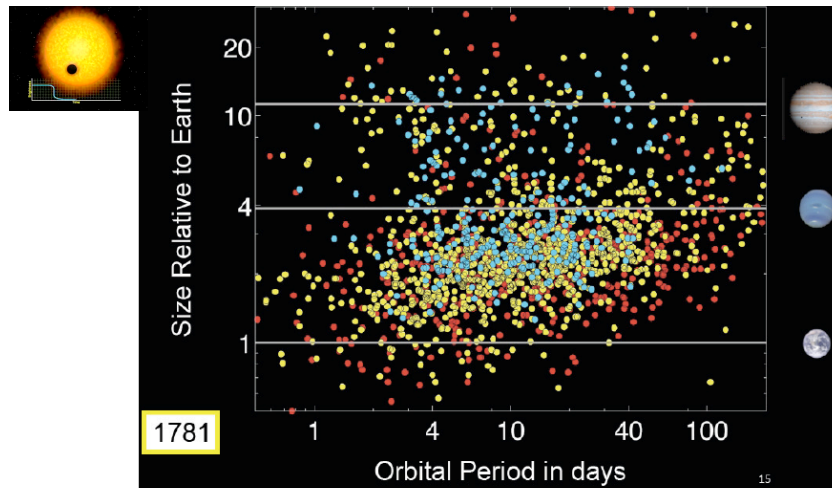

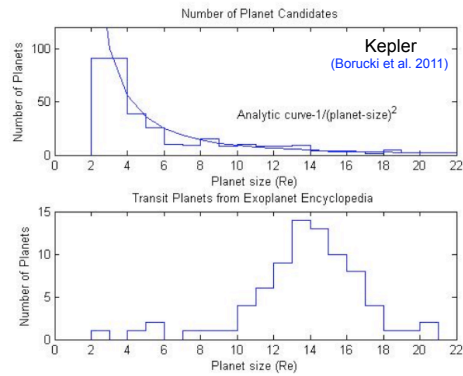

Fig. 2: The period-radius diagram for 1781 Kepler candidate planets as of September 2011.

Faint stars => mass determination through RVs very difficult
=> TTV in some cases (multi-planet systems)

Mass distribution

Size distribution

Multi-transiting KEPLER candidates
 170 systems / Feb 2011 \Rightarrow 346 systems / Feb 2012

Numbers of multiplanets:
 115 doubles, 45 triples, 8 quads,
 1 & 1 of five and six

Borucki et al. 2011
 Lissauer, Ragozzine,
 Fabrycky et al. 2011

230 doubles
 80 triples
 27 quads
 8 with 5 planets
 1 with 6 planets

Kepler systems

Warning
 No mass
 Not all definitive

• Same features as RV systems

• Systems with TTV's
 - Kepler-9 (Holmann et al. 2010)
 - Kepler-11 (Lissauer et al. 2011)

Very coplanar
 Formation/evolution process?

Kepler-11
6 planets

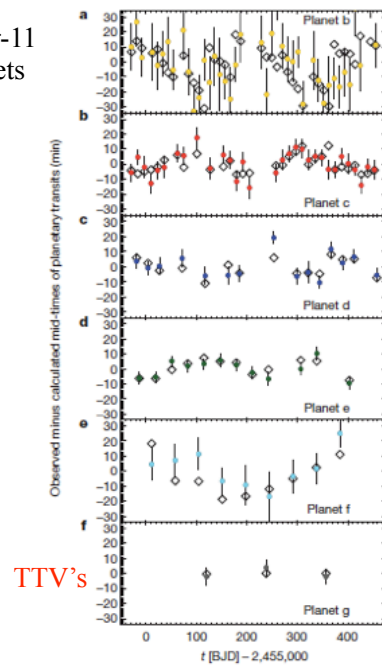

Figure 3 | Transit timing variations and dynamical fits. Observed mid-times of planetary transits (see section 3 of the Supplementary Information for transit-fitting method and Supplementary Table 2 for transit times) minus a

(Lissauer et al. 2011)

Observed mass-radius relationship

=> Diversity of composition

Summary of constraints/questions for theoretical approaches

- **Mass distribution**
 - Long tail towards high masses => Maximum mass of planets = $\sim 25 M_{Jup}$
 - Bimodal distribution => higher occurrence frequency for low-mass planets
- **Period distribution**
 - Increasing distribution (in logP) => reservoir at large sep => Dmax for formation?
 - Giant planets: peak at 3 days, "Solid" planets: no pile-up => migration?
- **Multi-planet systems**
 - All kinds: only small masses or giants, mixed
 - Systems seem to be packed => planet spacing?
- **Eccentricity distribution**
 - Large range of observed values => origin? Importance of dynamics!
- **Primary star properties**
 - Metallicity - frequency correlation for gaseous giants, not for small-mass planets
 - Mass of planetary material scales with primary mass
- **Constraints from transits**
 - Variety in M-R relation (size, density) => variety of internal composition
 - System geometry (large fraction of misaligned systems) => formation processes?
 - Multi-transiting systems => formation? Importance of dynamics?
 - The path to the characterization of habitability
